Appl. No. 10/735,837

Amdt. Dated April 30, 2009 Reply to Notice of March 31, 2009

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of

claims in the application:

Listing of Claims:

1. (Currently amended) An information processor to analyze the right

of access to a database having a data file in a form of a structured document,

the information processor comprising:

a query automaton generation unit for generating a query automaton

from a path expression in which a retrieval condition for the database is

described, wherein said path expression is extracted from a query requesting

access to said database;

an access control automaton generation unit for generating an access

control automaton from an access control policy in which an access control rule

is described; and

a logic operation unit for deciding access rights in database retrieval

using the path expression by performing logic operations related to the query

automaton generated by the query automaton generation unit and the access

control automaton generated by the access control automaton generation unit,

without accessing said data file stored in said database, said logic operation

unit issuing a decision which allows access, or does not allow access, to said

data in response to said query;

Page 2 of 12

Reply to Notice of March 31, 2009

a path expression extraction unit for extracting the path expressions from

a query expression specifying a retrieval method for the database; and

a query expression access right decision unit for deciding access rights

in the database retrieval by the query expression based on decision results of

access rights, which are obtained by the logic operation unit, for the individual

path expressions extracted from the guery expression.

2. (Original) The information processor of claim 1, further comprising a

schema automaton generation unit for generating a schema automaton from a

schema showing a structure of the data file stored in the database wherein the

logic operation unit performs decision of the access right in consideration for the

schema automaton generated by the schema automaton generation unit.

(Original) The information processor of claim 2, further comprising a

path table control unit for controlling path table describing paths of the data file

stored in the database wherein the schema automaton generation unit

generates the schema automaton from the path table controlled by the path

table control unit.

(Cancelled)

(Cancelled)

6. (Currently Amended) An information processor which analyzes access rights to a database having a data file comprising a structured document, the information processor comprising:

a path table control unit for controlling a path table describing paths of a data file stored in the database; and

an access right decision unit for selecting a predetermined path in the path table controlled by the path table control unit by a path expression describing a retrieval condition for the database, applying an access control policy describing access control rules and deciding an access right in database retrieval by the path expression with respect to the predetermined path;

a path expression extraction unit for extracting the path expressions from a guery expression specifying a retrieval method for the database; and

a query expression access right decision unit for deciding access rights in the database retrieval by the query expression based on decision results of access rights, which are obtained by the access right decision unit, for the individual path expressions extracted from the query expression, said selecting, applying, and deciding, extracting, and deciding being performed prior to retrieving said structured document in said database.

7. (Original) The information processor of claim 6, further comprising:

Appl. No. 10/735,837

Amdt. Dated April 30, 2009

Reply to Notice of March 31, 2009

a query automaton generation unit for generating a query automaton from a path expression in which a retrieval condition for the database is

described: and

an access control automaton generation unit for generating an access

control automaton from the access control policy in which the access control

rule is described,

wherein the access right decision unit selects the predetermined path by

use of the query automaton generated by the query automaton generation unit

and decides an access right to the predetermined path by use of the access

control automaton generated by the access control automaton generation unit.

(Cancelled)

(Cancelled)

(Currently amended) A database retrieval system, comprising:

a database storing an XML document; and

a preliminary an access rights analysis device which decides, based on

path expressions describing retrieval conditions used in retrieval for the

database and an access control policy describing access control rules, to which

one of

always permitted,

Page 5 of 12

2) always denied, and

indeterminate

an access right in the database retrieval using the path expressions

corresponds, said preliminary access rights analysis device deciding said

access rights without retrieving said XML document if said access right is

always permitted or always denied, and wherein if said access right is

indeterminate, then said database retrieval system accessing said XML

document to determine an access right.

11. (Previously presented) The database retrieval system of claim 10,

wherein the access rights analysis device includes:

a query automaton generation unit for generating a query automaton

from a path expression in which a retrieval condition for the database is

described;

an access control automaton generation unit for generating an access

control automaton from the access control policy in which an access control rule

is described; and

a logic operation unit for deciding access rights in database retrieval

using the path expression by performing logic operations related to the query

automaton generated by the query automaton generation unit and the access

control automaton generated by the access control automaton generation unit.

Page 6 of 12

12. (Original) The database retrieval system of claim 11, further comprisina:

a path expression extraction unit for extracting the path expressions from a guery expression specifying a retrieval method for the database; and

a query expression access right decision unit for deciding access rights in the database retrieval by the query expression based on decision results of access rights, which are obtained by the logic operation unit, for the individual path expressions extracted from the query expression.

13. (Original) The database retrieval system of claim 10, further comprising the access rights analysis device including:

a path table control unit for controlling a path table describing paths of a data file stored in the database; and

an access right decision unit for selecting a predetermined path in the path table controlled by the path table control unit by a path expression describing a retrieval condition for the database, applying the access control policy describing the access control rules and deciding an access right in database retrieval by the path expression with respect to the predetermined path.

14. (Original) The database retrieval system of claim 13, further comprising:

Reply to Notice of March 31, 2009

a path expression extraction unit for extracting the path expressions from

a query expression specifying a retrieval method for the database; and

a query expression access right decision unit for deciding access rights

in the database retrieval by the query expression based on decision results of

access rights, which are obtained by the access right decision unit, for the

individual path expressions extracted from the query expression.

15. (Currently amended) An access rights analysis method for

analyzing the right of access to a database storing an XML document by use of

a computer, comprising the steps of:

generating a query automaton from a path expression in which a retrieval

condition for the database is described, generating an access control

automaton from an access control policy in which an access control rule is

described and storing the generated query automaton and access control

automaton in a predetermined storage means, the path expression being

derived from a received query; and

performing logic operations related to the query automaton and the

access control automaton, which are stored in the predetermined storage

means, and deciding an access right in database retrieval using the path

expression without checking the XML documents stored in the database, and

issuing a decision allowing access or not allowing access to said database.

(Cancelled)

17. (Currently Amended) A computer readable medium encoded with a

computer program for analyzing the right of access to a database handling a

data file as a structured document, by controlling a computer, the program

causing the computer to function as:

a query automaton generation means for generating a query automaton

from a path expression in which a retrieval condition for the database is

described;

an access control automaton generation means for generating an access

control automaton from an access control policy in which an access control rule

is described; and

a logic operation means for deciding access rights in database retrieval

using the path expression by performing logic operations related to the generated query automaton and access control automaton, without accessing

said data file:

a path expression extraction means for extracting the path expressions

from a query expression specifying a retrieval method for the database; and

a query expression access right decision means for deciding access

rights in the database retrieval by the query expression based on decision

 $\underline{\text{results}}$ of access rights for the individual path expressions extracted from the

query expression.

18. (Cancelled)

19. (Currently Amended) A program for analyzing the right of access to

a database handling a data file, described in a form of a structured document,

by controlling a computer, the program allowing the computer to function as:

a path table control means for controlling a path table describing paths of

a data file stored in the database; and

an access right decision means for selecting a predetermined path in the

path table controlled by the path table control unit by a path expression

describing a retrieval condition for the database, applying an access control

policy describing access control rules and deciding the presence of an access

right in database retrieval by the path expression with respect to the

predetermined path without accessing said data file;

a path expression extraction means for extracting the path expressions

from a query expression specifying a retrieval method for the database; and

a query expression access right decision means for deciding access

rights in the database retrieval by the query expression based on decision

results of access rights for the individual path expressions extracted from the

query expression.
